

Camping on the coast line with Hunting Family Izola

- Hunting Family Izola-Let's visit the forest

Beautiful, sunny, and warm days have begun, inviting us to the outdoors. Children need to be given the opportunity to discover miraculous and exciting things outdoors. Too often, parents rush through unspoiled nature and drag their children with them. If you take the time to stop and explore, the trips will be a lot more fun for everyone. Nature offers us a lot of opportunities to spend time actively with children. The forest is a very pleasant environment with adequate protection.

Activity:

- Assistance to surrounding farmers and maintenance of forest paths

- Hunting facilities, yarns, hunting weapons and automatic feeding stands

Hunting from the prey or from the stand is suitable for those hunters who like to observe the surroundings in silence from the city. It is an extremely peaceful, quiet, and beautiful way of hunting, in which we notice absolutely all the details and beauties of nature. To make the game feel safe, we come and go to the prey extremely quiet and collected. We hunt from the prey or from the stand wherever game is more often kept, which is close to their paths (herds), in places where they graze, feed or drink (puddles) and at various crossings. Hunting with prey can be carried out in all hunting grounds in our country, but it is possible in different seasons, depending on the hunting season of each game. Using automatic feeding stands will save you time and money.

The purchase cost can be saved in as little as 3-4 months if, for example, you must drive 10 km every day to check or charge the controller. Regular feeding of game is also guaranteed during your holidays or long absences.

Activity:

- Installation of new prays, stands and renovation of existing ones
- Maintenance around automatic feeding stands and charging
- Cleaning and lubrication of weapons

- Hunting dogs – cynology

Cynology is a common name for the activity of people involved in the breeding of domestic dogs or their breeds, education, and informal study of the species. Although the word cynology is reminiscent of a scientific discipline, it is not, as dogs are studied by zoology. Hunting cynology is the activity of hunters who are engaged in:

- ♣ breeding, education, training, and management of hunting dogs,
- ♣ care and health care for hunting dogs,
- ♣ organization and implementation of physical assessments, breeding inspections and exhibitions of hunting dogs,
- ♣ organizing and conducting tests of hunting dogs of local, national, and international character,
- ♣ training of breeders, responsible guardians, and guide dogs,
- ♣ keeping records, planning, and preparing work programs in hunting cynology.

The use of hunting dogs for hunting is defined by the Game and Hunting Act. The provisions of the hunting law and hunting ethics directly oblige hunting ground managers and hunters that hunting is possible only with the help of hunting dogs. These are purebred dogs from the various breed groups. Hunting dogs are used in various types of hunting (bracada, propulsion, tracking wounded game, caving, and bringing game from the water), and they prove their hunting usefulness by testing natural designs and performing tasks in hunting practice.

Activity:

- Working with hunting dogs in the hunting ground

- Getting to know hunting guards and their work

A hunting guard can become an adult citizen of the Republic of Slovenia who has a firearms certificate and has passed the exam for a hunting guard and has a three-year hunting practice as a member of a hunting organization. Before starting the service, the hunting guard must submit a certificate of passing the hunting guard exam and a weapon certificate and submit a declaration to the competent administrative body that he will perform his service conscientiously and impartially in accordance with the law. issued by the competent administrative authority.

During the performance of his / her duty, the hunting guard is authorized to:

- ♣ persons who have violated or intend to violate the provisions of this act, stop, verify their identity, and inform the controller, hunting inspector and, if necessary, the competent authority for internal affairs,
- ♣ temporarily confiscates weapons or hunting devices from persons with weapons or hunting devices in a special purpose or hunting ground and do not have the right to participate in hunting and brings persons in and hand over the seized items to the competent body for internal affairs,
- ♣ in cases where there are grounds for suspecting that evidence of violations of the provisions of this act is hidden in vehicles or luggage, request their extradition and inform the competent authority for internal affairs,
- ♣ on the order of the Slovenian Forest Service or the hunting inspector, the game is shot, if it has not been performed by the concessionaire in accordance with the concession contract,
- ♣ carries hunting weapons in accordance with the regulations on weapons when performing the hunting guard service. A hunting guard may use hunting weapons in self-defense in accordance with regulations (Article 73 of ZDLov-1).

In cases where informing the competent authority for internal affairs or the hunting inspector would endanger the health and life of people by delaying immediate action, the hunting guard is authorized to act at his own discretion.

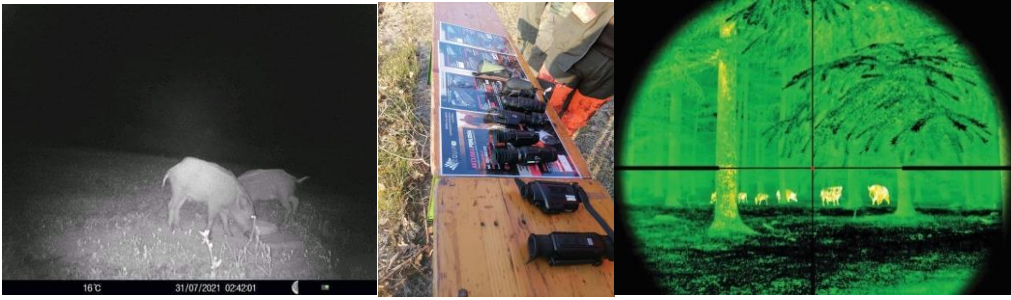

Activity:

- Control of the hunting ground with a hunting guard and game inventory (animals)

- Visit to the hunting ground at night - thermal imaging

The light reflected from various objects in our surroundings all the way to our eye allows us to see these objects with the eye. There are senses (receptors) in the eye that perceive light, and these stimuli are transmitted to the brain by the optic nerve. The brains can recognize these stimuli as a picture of our surroundings. Illuminated bodies are those on which light falls and is reflected from them. But there are also bodies that emit light themselves - in nature they are stars at night, the Moon, etc. Night optics capture this light (enough light is enough) and amplify it with the help of an amplifier so that we can see images with our eyes. The picture we see is clear, natural, and detailed, which means that we can also estimate the object very accurately. In addition to night optics, we also know thermal optics or thermovision, which works on the principle of heat perception (radiation). When the temperature of an object is higher than its surroundings, the optics create an image. Thermal optics also do not need visible light to create this image. This means that we can see even the smallest objects, which e.g. at night it is covered with fog or other cover and you would not see them with night optics. However, it is necessary to be aware that the thermal image is not as detailed and natural to our eyes as it is with night optics. This category includes monoculars, binoculars, goggles, and accessories for shooting optics.

Activity:

- Control of game (animal) movement at night

- Game preparation and recipes

Activity:

- Skinning and proper preparation of meat

- Preparation of venison dishes

Price list and rental rules:

- Hunting facilities, yarns, hunting weapons and automatic feeding stands 100 € / day
- Hunting dogs - cynology 100 € / day
- Getting to know the hunting guards and their work 50 € / day
- Visit to the hunting ground at night - thermal imaging 150 € / day
- Game preparation and recipes 150 € / day
